## 

# E-Cell MK-3MiniHT Stack

## Hot Water Sanitizable Electrodeionization (EDI) Stacks

Figure 1: E-Cell MK-3MiniHT Stack

#### **General Description**

As part of the E-Cell\* electrodeionization product line, the E-Cell MK-3MiniHT Stack is designed to:

- Use electrical current to provide ultrapure water for the pharmaceutical and biotechnology industries, as well as laboratories.
- Be hot water sanitizable up to 185°F (85°C) for 160 cycles
- Deliver premium performance including both the highest levels of product water quality and the lowest energy consumption.
- Minimize cleaning requirements at higher feed water hardness levels using counter-current operation.
- Be leak free, guaranteed.
- Operate continuously and require no caustic or acid for regeneration of ion exchange resin within the stack.
- Require no brine injection or concentrate recirculation.

### **Typical Applications**

The product water from the E-Cell MK-3MiniHT can be relied upon to exceed USP, EP and other pharmacopeia required quality levels in applications such as:

- Water for injection
- Pharmaceutical purified water
- Laboratory purified water systems

For ease of design and additional confidence in your EDI application, E-Cell performance projections and guarantees are available in the Winflows\* software or by contacting Veolia.

#### **Quality Assurance**

- CE, RoHS, CSA and EAC marked
- Materials in contact with fluids processed by the E-Cell MK-3MiniHT stack meet FDA requirements
- Manufactured in an ISO 9001 and ISO 14001 facility
- E-Cell MK-3MiniHT Stacks are halal certified by the Islamic Food and Nutrition Council of America (IFANCA<sup>®</sup>)

MK-3MiniHT Stack Specifications				
Nominal Flow	1.14 m <sup>3</sup> /h	5.0 gpm		
Flow Rate Range	0.57–1.52 m³/h	2.5–6.7 gpm		
Shipping Weight	52 kg	115 lbs		
Dimensions (width x height x depth)	30 cm x 61 cm x 29 cm	12" x 24" x 12"		

#### WATER TECHNOLOGIES

Product Water Quality Note 1				
Guarantees Available				
	> 10 MOhm-cm			
Resistivity	Higher and lower guarantees			
	also available			
Sodium	< 3 ppb			
Silica (SiO <sub>2</sub> )	As low as 5 ppb			
Typical Removal Efficiencies				
Sodium	> 99.9% removal			
Silica (SiO <sub>2</sub> )	Up to 99% removal			

Operating Parameters					
Recovery	Up to 93%				
Voltage	0–150 VDC				
Amperage	0–5.2 ADC				
Inlet Pressure Note 2	< 6.9 bar		< 100 psi		
Pressure Drop Note 3	1.4–2.8 bar		20–40 psi		
Number of 1 Hour Sanitization Cycles	160 cycles				
Maximum Sanitization Temperature	85ºC	185⁰F			
Maximum Sanitization Inlet Pressure	2.1 bar	30 psi			

#### Notes:

- 1. Actual performance may vary depending on site conditions. Reference Winflows projection software to verify expected product water quality as well as the resistivity, sodium, and silica performance guarantees that are offered for the design conditions. To obtain boron or other guarantees, contact Veolia.
- 2. Inlet pressure is determined by the downstream pressure requirements for the product and concentrate streams, the choice of counter-current or co-current operation, and stack pressure drop.
- 3. At nominal flow and 25°C. Reference Winflows projection software to verify for design conditions.
- 4. Reference the Winflows projection software and the E-Cell Stack Owner's Manual to verify feed water specifications for the design conditions.
- 5. TEA (ppm as CaCO<sub>3</sub>) Total Exchangeable Anion, this represents the concentration of all of the anions present in the feed water including contributions from OH<sup>-</sup>, CO<sub>2</sub> and SiO<sub>2</sub>. Winflows must be used to confirm the feed water TEA is acceptable at the specific applications' operating conditions. Table value is at minimum flow and maximum temperature.
- 1.0 ppm as CaCO<sub>3</sub> feed water hardness limit applies to standard counter-current flow operation only. Allowable feed water hardness decreases to 0.1 ppm as CaCO<sub>3</sub> in co-current flow operation.

Feed Water Specifications Note 4					
Total Exchangeable Anions (TEA as CaCO <sub>3</sub> ) Note 5	< 60 mg/l	< 60 ppm			
Conductivity Equivalent	< 103 µS/cm	< 103 µS/cm			
Temperature	4.4–40°C	40–104°F			
Total Hardness (as CaCO <sub>3</sub> ) <sup>Note 6</sup>	< 1.0 mg/l	< 1.0 ppm			
Silica (SiO <sub>2</sub> ) Note 7	< 1.0 mg/l	< 1.0 ppm			
Total Organic Carbon (TOC as C)	< 0.5 mg/l	< 0.5 ppm			
Total Chlorine	< 0.05 mg/l	< 0.05 ppm			
Fe, Mn, H <sub>2</sub> S	< 0.01 mg/l	< 0.01 ppm			
Boron Note 8	< 1.0 mg/l	< 1.0 ppm			
рН	4 to 11				
Oil & Grease	None detectable				
Particulate Note 9	RO permeate				
Oxidizing Agents	None detectable				
Color Note 10	< 5 APHA				

- Allowable silica limit decreases above nominal flow. Allowable silica limit decreases to 0.5 ppm with feedwater hardness above 0.5 ppm as CaCO<sub>3</sub>.
- 8. The boron feed level is limited to 0.3 ppm as B whenever there is a silica guarantee requirement or resistivity guarantee requirement above 10 MOhm-cm, as higher boron levels could impact performance. Without these requirements the limit is 1.0 ppm boron.
- 9. Reverse Osmosis (RO) or equivalent feed water: RO provides EDI feed water that is substantially free of particulate matter, colloidal material and high molecular weight organic substances, which can foul ion exchange media. RO permeate quality is specified since EDI stacks contain packed beds of ion exchange medium that cannot be backwashed/fluidized to remove particulate matter. Systems with an open system between a RO system (or other source) and E-Cell (ex. tank, decarbonator) must be fitted with filters immediately preceding the E-Cell, to protect the E-Cell against contamination with particulate matter. Generally, a 5 µm absolute or 1 µm nominal filter will be acceptable.
- 10. APHA color standard/scale named for the American Public Health Association and defined by ASTM D1209.
